

How do I enter days supply in prescriptions and medications on the iPad?

07/24/2024 4:00 pm EDT

This feature is currently only available to select pilot program users. It will be available for all users in the coming weeks.

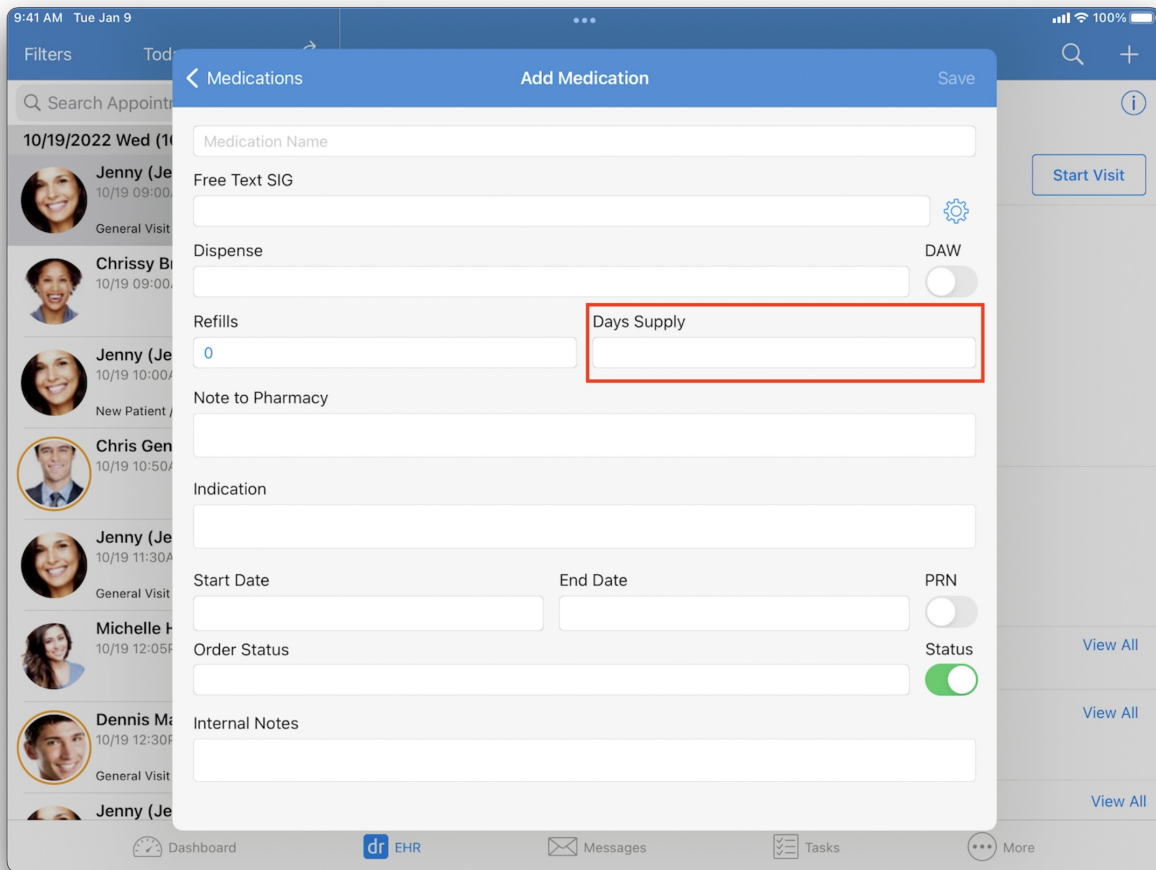

You can add the days supply to prescriptions you send and medications you add to a patient's chart. The days supply field is required for schedule II controlled substance prescriptions. Days supply can help reduce the pharmacy clarification rate and improve the accuracy of PDMP such as the Morphine Milligram Equivalent (MME) associated with each dispensing.

When you send a prescription, there is a Days Supply field for you to enter the supply for the medication.

Tap the patient's name and then select **Send eRx**

The screenshot shows the iPad interface for entering medication information for a patient named Jenny Harris. The interface includes a top navigation bar with 'Close', 'Active Meds', 'Favorites', and 'Preview'. Below the patient name, there is a list of medications, with the first one selected. The medication entry form includes fields for Medication Name, Unknown, RX, Generic, Free Text SIG, Dispense (0.0), Unit, Refills (0), and Days Supply (highlighted with a red box). There are also checkboxes for Dispense as Written and Add to PT Med List, and a Note to Pharmacy field. At the bottom, there are sections for Pharmacy (Walgreens #00689) and Prescriber (Demo Prescriber).

If you are [adding a medication](#) to the patient's chart, you can also enter the days supply. Tap the patient's name, select **Medications**, and tap on the plus sign in the top right corner.

You can also edit a days supply on the iPad. Tap the patient's name, tap **Medications**, and choose which medication you'd like to edit.
