

# DrChrono EHR Mobile v2026.06.0 v1

06/25/2026 2:22 pm EDT

The gap between what you can do on mobile and what you can do on web just got meaningfully smaller. Six clinical documentation fields that previously required a browser are now available directly in the app, e-prescribing gets clearer guidance and smarter validation, and EverHealth Scribe has two enhancements on the way – all backed by ten stability fixes that make the app more reliable.

**Version:** v2026.06.0    **Platforms:** iPhone · iPad · Mac

**In this release:**

## □ Compliance & Regulatory

### Document complete patient histories directly from your iPhone or iPad

iPhone & iPad

Providers

Clinical Staff

Six USCDI clinical form fields – previously web-only – are now available in mobile forms. Clinical Test/Result, Pregnancy Intent, Pregnancy Status, Planned Procedure, Smoking Status, and Education Level can all be documented directly from the app.

- All six fields sync in real time with web records and CCDA outputs – no double entry required
- Searchable dropdowns with standardized codes (LOINC, SNOMED, CPT) – no manual code entry
- Mobile date pickers throughout for consistent, formatted date entry

#### NO ACTION REQUIRED

These fields appear automatically in your existing clinical forms once you update the app.

## □ Clinical

### Clearer guidance when e-prescribing actions are restricted

iPhone & iPad

Providers

Clinical Staff

Informational banners now appear throughout the app when e-prescribing isn't available in the current context – for example, when a staff member needs a provider to sign off, or when a user is working in another provider's account.

- Staff users see a clear prompt that provider signature is required before a prescription can be sent
- If you're working in another provider's account, you'll be guided to switch back before prescribing
- The same guidance applies to renewal requests, medication changes, and cancellations

## HEADS UP

No changes to how prescriptions are sent. This update adds clarity, not new restrictions.

## Required fields are validated before a prescription is sent

iPhone & iPad

Providers

Clinical Staff

Before an e-prescription can be submitted, the app now checks that required fields — including patient directions (SIG) and dispense quantity — are complete. For pediatric patients, a warning appears if height or weight is missing.

- Fewer submission errors from missing required information
- Pediatric vital sign check (height/weight) runs before sending — prompts to enter missing data or warns before proceeding
- Clear in-app prompts point to any incomplete fields before you can send

## ⚙️ Platform & Reliability

### See what's new before you update

iPhone & iPad

Everyone

The in-app update notification has been redesigned to show you what's in a new version before you install it — including the version number, release highlights, and a "Remind Me Later" option if the timing isn't right.

- Preview release notes before updating so you know what to expect
- Tap "Remind Me Later" to defer without losing the notification
- Refreshed branding for a more recognizable update prompt

### Try AI-powered documentation — express interest in EverHealth Scribe

iPhone & iPad

Providers

EverHealth Scribe is DrChrono's AI-powered documentation tool that listens to your patient encounter and drafts a complete, structured clinical note in real time — so you can stay fully present with your patient instead of typing. Notes are generated in your existing templates, ready to review and sign.

Providers not yet enrolled may now see an informational banner in the app. Tap "I'm Interested" to connect with the EverHealth team — or dismiss the banner and it stays hidden for 90 days.

- One tap connects you with the team for a follow-up conversation

☐ Dismiss once and the banner stays hidden for 90 days across all your devices and reinstalls

As part of this release, we are continuing our ongoing work to assess, monitor, and address any security vulnerabilities.

## ☐ What's Fixed

**App no longer closes when opening task messages** — Selecting a task and viewing its messages now works reliably

**CPT codes stay visible after applying a diagnosis pointer** — Billing codes no longer disappear when a Dx pointer is assigned

**Problem onset dates now display correctly** — Missing onset dates show as blank instead of 01/01/2000

**Infant ages now display in months** — Patients under one year now show age in months instead of "0"

**Sign and Lock Note button appears active when available** — The button no longer appears greyed out when the action is available to you

**Patient history documents load completely** — Filled and uploaded documents no longer appear blank in Patient History

**Visit dates and vitals load in multitasking modes** — Data now displays correctly in Windowed Apps and Stage Manager

**Patient history loads consistently for all patients** — An issue causing history to fail for certain patients has been resolved

**PDF documents display in the correct orientation** — Portrait PDFs no longer open in landscape

**Allergy filter cleaned up** — The "Drug Ingredients" filter option, which was no longer supported, has been removed

## Coming up

Features in active development for EverHealth Scribe users — arriving in a future update.

**EverHealth Scribe**

## Rich text formatting in Yellow Notes

**EverHealth Scribe**

**Providers**

Your AI-generated notes will preserve their structure when they land in Yellow Notes — bold text, italics, and bullet points intact. No more manually reformatting after Scribe does its work, so the note you review is the note that gets signed.

- ⇒ Format Yellow Notes with bold, italics, and bullet points
- ☐ EverHealth Scribe output preserves formatting end-to-end
- ☐ Less time cleaning up notes, more time on patient care

## AI CPT & diagnosis recommendations

EverHealth Scribe

Providers

Billing Staff

Scribe's coding intelligence is getting smarter. AI-generated diagnosis and CPT suggestions in Clinical Notes will align more closely with billing rules and coding guidelines — catching issues before they reach the biller and reducing back-and-forth between the exam room and the billing team.

- ☐ More accurate, compliant coding suggestions from the point of care
- ☐ Fewer manual corrections and claim denials downstream
- ☐ Tighter connection between clinical documentation and clean claims
